**Come
Rain or
Shine**

A WATER-SMART SUMMER

MINDFUL COLOURING

Planet Earth gives us everything we need - air to breathe, water to drink and food to eat. And while nature is strong, it can't protect itself without us.

The small choices we make everyday such as recycling and saving water are actions that help keep our planet thriving, not just for us, but for every living thing that calls Earth home.

Plants need two things to grow: rain for water and sunshine for energy. But sometimes it doesn't rain enough. That's why it's so important not to waste water.

When we save water, we help make sure there's enough for everyone - plants, animals, and people too.

An ant might be tiny on its own, but together with its colony, ants can do amazing things - like building bridges and carrying things much bigger than themselves.

Just like ants, when we all do our part - like turning off the tap while brushing our teeth, fixing drips, and only using the water we need - we can achieve something powerful.

Because when we work together, small actions add up to something big for our planet.

We need water to grow the fruit and veggies we eat - but that's not all! Water is essential for all life. During dry spells when it doesn't rain much, it can be harder for plants and animals to get the water they need.

Collecting rainwater in water butts or saving water used around the house means we can reuse it in the garden.

A water butt is like a giant bucket that collects rain from the roof. It's a clever way to save water. We can use the water to feed thirsty plants, clean muddy boots or even wash the car!

By collecting and reusing rainwater, we help save clean tap water for things we really need - like drinking and cooking.

All the water we use at home eventually flows into rivers and oceans.

If we use less water and keep drains free from rubbish and chemicals, we help sea creatures live in clean, healthy homes.

When you care for nature by looking after plants and saving water, you help keep Earth clean, green and full of life.

Every drop you save and every choice you make, like turning off the tap or fixing a drip, really does make a difference.

Your actions today help protect the planet for tomorrow. You have the power to help - and it starts now!
